These inserts may have left behind some "oozy" debris on the back. You can clear this debris by screwing a screw all the way from the other end and then removing it.

ITEM NO.	DESCRIPTION	QTY.
1	Wedge Plate	1
2	Base Tool Plate with Inserts	1
3	M3 Flathead Screw, 8mm long	3

Follow the V6 or Volcano Hotend Assembly Instructions from E3D to assemble the hotend shown below.

[V6 Instructions](#)

[Volcano Instructions](#)

Temporarily wire your extruder to your machine, perform a heater calibration, and fully hot-tighten the extruder. Then disconnect the wires.

[heater calibration instructions](#)

hot-tightening instructions are at the end of the Extruder Assembly instructions.

1

The PTFE Tube length is different depending on what hotend you will use (V6 or Volcano).

For the V6, cut 62mm of PTFE Tube.

For the Volcano, cut 53mm of PTFE Tube.

In both cases, ensure that the resulting cut is clean on both ends.

Ok!

Not Ok!

With a box cutter blade, "shape" one end of the PTFE tube into a slight cone like shown below.

Ensure that the PTFE tube is **clean** after this step, as small flake of tubing can lead to nightmarish clogging scenarios.

When finished push the tube all the way into the hotend until it stops. The "shaped" end should stick out.
