SHEET 1 OF 16

Install these heat sert inserts using the Plate Press Technique

Be gentle as the heat from the installation tool can warp the flatness of the back surface of the part. If that happens, cool the part on a flat metal plate while applying gentle pressure to flatten it.

Install these heat sert inserts using the Plate Press Technique

Be gentle installing these front heat set inserts as they can warp this corner of the plastic.

If you see this plastic warping, you can still push it back to it's original form while the plastic is still warm.

Note that the top inserts go in opposite corners.

Use the nut tightener to secure the heatsink.
Remove the tightener when done.

Do not use this part of the hotend as a way to hold onto the assembly while tightening or the heatbreak will snap. Instead, hold onto it from the heatsink.

SHEET 10 OF 16

Use a PTFE Tube Cutter to cleanly cut the PTFE tube to the length specified below.

Ensure that the resulting cut is clean on both ends.

OK!

Not OK!

With a box cutter blade or chamfering tool, shape one end of the PTFE Tube.

Ensure that the PTFE Tube is clean on both ends and there is no debris anywhere in the tube or at the tips.

Warning: it is **absolutely critical** that the PTFE tube is cut cleanly and has **no debris**. Any small flakes of PTFE tube will result in horrific tool jams that are hard to debug
